

DESIGN FEATURES

- 32-bit Windows** Double Take fully supports 32-bit capabilities, such as Windows 95/NT controls, long file names, and large file (over 2 GB) access. Even Microsoft's Visual FoxPro can't handle the large files that Double Take for Windows can.
- Blazing speed** 2-8+ million records per hour - many times faster than any other merge/purge for the PC.
- Unlimited number of databases** in a single processing run.
- Fast access to data** Process dBASE and ASCII files directly. Plus, access many other databases using ODBC. No need to bring each file in to the same software format - a great time saver.
- Flexible Field Mapping** Source files don't need to have a common structure - another great time saver.
- On-the-fly Splitting** Splits Names, Addresses, and City/State/Zips split in real time - yet another great time saver.
- Simple setup screens** Easy to learn and use. Step by step **Wizard** for first time users.
- Matching Technologies** Each matchcode component can be set separately: Exact, Phonetex, Soundex, Character Occurrence, Near Matching, Swap Matching, Nicknaming, and Company Acronyms ("GE"="General Electric").
- Concurrent Matching** Match using several criteria simultaneously (ie, Zip+Last Name+Street #+Street Name -or- Zip+PO Box -or- Zip+Phone).
- Unmatched Control** You can choose from pre-designed matchcodes or -- because you know your data better than anyone -- you can create your own matchcodes from any parts of any fields.
- File/Field ranking** Prioritize by file or by the contents of a field. Alternately, you can have Double Take choose the most complete record, choose randomly, or take an equal number from each source file.
- Suppress and/or Intersect** while deduping. No need to make additional passes over your data.
- Gathering** Consolidates fields with different kinds of data from different files into a complete "master record".
- Scattering** Distributes accumulated data between to source files.
- Comprehensive Analyzer** The best tool for verifying (and editing) results, tweaking matchcodes, and producing dupe listings.
- Householding** Extensive. You can stack a "virtual array" about a single household.
- Reporting** Processing Summary, File Summary, Dupe Matrix, Quality Matrix, Matchcode Matrix, Matchcode Quality, Source Code List, Source Code File Summary, Source Code Dupe Matrix, and Source Code Quality Matrix. More reporting than any other merge/purge for the PC.
- Enhanced Report Printing** with informative charts and graphs. User modifiable templates.
- It's YOUR program!** You can customize any and all lookup tables. It has extensive "user defaults" so you can make it jump through hoops -- YOUR way!
